

Piping maintenance installation in the fuel preparation system for dust boilers

In June 2016 EKOZUB Ltd. Company launched the maintenance in patency the installation of the WP-70 flue gas boiler at Heat Engineering Ltd. Company in Gliwice. The installation consists of three shock wave generators GFU-24/8, one for each tube-drier. The systematic operation of the generators keeps the flue gas inlet from the combustion chamber clean. Maintaining the cleanliness of the piping ensures the safe operation of the fan mill and the boiler. Thanks to the use of GFU-24/8 shock wave generators manual cleaning of the tube-driers was eliminated, that was be done under very dangerous conditions. The work of generators did not adversely affect the inner surface of the tube-driers.
